COMPLETE GENOME SEQUENCE OF THE MACTORIAN THE MITTROGEN FIXATION ARE
COMPLETED BY THE MITTROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THE
COMPLETE GENOME SECUENCE OF THE MOLYBDENUM-IRON PROTEIN
C. I. CATALYZED BY THE MITTROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THE
C. I. CATALYZED BY THE MITTROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THE
C. I. CATALYZED BY THE MOLYBDENUM-IRON PROTEIN
C. I. CATALYZED BY THE MOLYBDENUM-IRON PROTEIN
C. I. CATALYZED FERREDOXIN + 6 H(+) + N(2) + N ATP =
C. JONIDIZED FERREDOXIN + 2 NH(3) + N ADP + N ORTHOPHOSPHATE.
C. I. SUBUNIT: TETRAMER OF TWO ALPHA AND TWO BETA CHAINS THAT BINDS
C. JONIDIZED FERREDOXIN + 2 NH(3) + N ADP + N ORTHOPHOSPHATE.
C. JONIDIZED FERREDOXIN + 2 NH(3) + N ADP + N ORTHOPHOSPHATE.
C. JONIDIZED FERREDOXIN + 2 NH(3) + N ADP + N ORTHOPHOSPHATE.
C. JONIDIZED FERREDOXIN + 2 NH(3) + N ADP + N ORTHOPHOSPHATE.
C. JONIDIZED FERREDOXIN + 1 NH ATP + NH

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:40:44 1999; MasPar time 6.10 Seconds 134.150 Million cell updates/sec

Tabular output not generated.

Sequence: Description: Perfect Score: Title: >US-08-991-628-6 (1-15) from US08991628.pep 109 SARTLNNRYTGPYTF 15

Scoring table: PAM 150 Gap 15

Searched: 179066 seqs, 54579741 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptremb19

1:sp_archea 2:sp_bacteria 3:sp_fungi 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Mean 26.176; Variance 36.644; scale 0.714

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 17.125; Variance 54.917; scale 0.312

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

either an isolated human non-collagen or non-myslin basic protein (MBP) polypeptide which is capable of tolerising an individual to an autoantigen; or an isolated human pathogen polypeptide capable of polypeptide (whether self or non-self) includes in both cases, the polypeptide (whether self or non-self) includes an amino acid sequence corresponding to a sequence motif for a MHC class II protein, such as HLA-DR, which is associated with a human autoimmune disease and which binds to the polypeptide to activate autoreactive derived from the human desmoglein 3 protein (amino acids 762-786) and is implicated as a self epitope in pemphigus vulgaris. Peptides derived from the-human desmoglein protein are described in w04841-47.	WO9627387-A1. 12-SEP-1996; U03182. 07-MAR-1995; US-400796. (HARD) HARVARD COLLEGE. Strominger JL, Wucherpfennig KW; WPI; 96-425218/42. Pemphigus vulgaris auto-antigens and multiple sclerosis non-self antigens - useful in disease treatment, and method for identification of other self and non-self antigens implicated in auto-immune disease Claim 1; Page 42; 58pp; English. This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosis and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-JUN-1993 (first entry)
Human pemphigus vulgaris 130kD antigen.
Pemphigus vulgaris; skin disease; autoantibodies;
keratinocyte cell surface antigen; glycoprotein; cell adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Viral haemagglutinin neuraminidase.
Haemagglutinin neuraminidase; vaccim
Rovine parainfluenza type III virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 93-067436/08.

                                                                                                                                                                                                                                                                       Recombinant vaccinia virus - is which all or part of DNA coding membrane fusion protein in combined to genom region.

Disclosure; p; Japanese.

Fragment of parainfluenza viral membrane fusion protein encoding may be incorporated into the vaccina virus, which may then be use as a live vaccine for cows.

Claim 6; Page 29; 49pp; English.

Claim 6; Page 29; 49pp; English.

Transgenic plants expressing this cold acclimatization

protein have improved cold tolerance and/or drought-resistance.

The cell expressing the protein is from the family Solanaceae,

a citrus plant, a bacterium or a yeast cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PT DNA encoding MHC class II trans-activator polypeptide(s) - useful procession of expression of genes encoding MHC in dendritic cells or as inhibitors of expression of genes encoding MHC in dendritic cells placlosure; Pages 66-69; 86pp; French.

The present sequence represents type IV CIITA (class II transactivator) protein. The products can be used to treat diseases for which cenhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired for dendritic cells or after induction by a cytokine, especially can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cc deleted and can be used for reducing the expression of major chistocompatibility complex (MHC) class II antigens. A ribozyme target in comparison to bases 1159-1161 (GUA) of human CIITA mRNA, or corresponding target in cother species and the CIITA polypeptide can be used to reduce expression co of MHC class II antigens, particularly for treatment of autoimmune content of autoimmune calls content of autoimmune competition. It has no transcription activity but still binds to regulatory proteins in the promoter region of class II genes, so competitively inhibits endogenous CIITA.
                                                                                                                                                                                                                                                                                            Query Match

Transforming a bacteria with the PPC encoding sequence intensifies CO2 fixation ability. Other PPC genes may also be found by hybridisation with an A.nidulans derived probe.

This represents a class II trans activator (CIITA) polypeptide. When the N-terminal region of the CIITA is deleted, it can be used for reducing the expression of major histocompatibility complex (MKC) class II antigens. A ribozyme targeted to-bases 1159-1161 (GUA) of human CIITA mRNA, or corresponding target in other species and the CIITA polypeptide can be used to reduce expression of MHC class II antigens, particularly croman to autoimmune disease (e.g. arthritis and diabetes) or to the croman animals intended as source of xenografts. The ribozyme can the CIITA polypeptide may be generated in vivo by gene therapy, using the encoding nucleic acids targeted for localised suppression of the climanne response. Material from transgenic animals in which at least some cells are stably transfected with the CIITA encoding nucleic acids are used for animal-to-human transplantation. The CIITA polypeptide coused for animal-to-human transplantation. The clira the express them constitutively or after lymphokine induction. It has no transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The present sequence represents type II CIITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Class II trans activator (CIITA) polypeptide.

Class II trans activator; MHC; CIITA; autoimmune disease; treatment; transplantation; xenograft; major histocompatibility complex; diabetes; gene therapy; arthritis; ribozyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 98-559115/48.

DNA encoding MHC class II trans-activator polypeptide(s) -e.g. as primers for enzymatic amplification, as detection e.g. as primers for enzymatic amplification, as detection
                                                                                                                                                                                                                                                                                                                               antigen expression - and ribozyme directed to trans-activator mRNA, related nucleic acid, vectors, transformed cells and antibodies, used for treating auto-immune disease and to inhibit xeno-graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO9815626-A2.

The present sequence represents type III CIITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W80313;

If gene encoding a protein displaying class II trans-activator protein encoding a protein displaying class II trans-activator protein the protein sequence is encoded by the gene represented in Q88110. CC This protein sequence is encoded by the gene represented in Q88110. CC This protein is a class II transactivator (CIITA) essential for the CC control of MHC class II gene expression in Blymphocytes. The DNA CC sequence has two in frame start codons. The first of these is at position CC in and acts as the translation initiation site. The second is present CC (at position 188) in the context of a perfect Kozak box and may also CC contains three stretches rich in proline/serine/threonine. It also CC contains three stretches rich in proline/serine/threonine. It also CC contains a region rich in glutamate/aspartate (an accidic region) and an ATP/GTP binding cassette. The acidic regions followed by three stretches CC arctivation domain. There is also a leucine-rich region around amino CC acids 979 to 1061 that shows weak homology with the N terminal portion of a yeast RNA binding protein. The protein can be used for the CC sequence can be used to treat diseases where a decrease in the level of cartivation. The cells II genes is desired e.g. insulin dependant CC artheirs, multiple sclerosis, lupus erythematosis and rheumatoid

Example 1; Page 36-41; 64pp; English.
A genomic DNA sequence (T18028) codes for the class II
transactivator, CIITA (R81569), a protein essential for activation
of transcription of MHC class II genes. The CIITA transcription
activation domain provides useful information for identifying cpds
which inhibit CIITA-dependent transcription. Such cpds. are

A second pour foriTA, the interaction domain, mediates interaction of CIITA and its target protein and activates MHC class II promoters. Cpds. that inhibit this binding are also potential autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a type I CITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.

Starch liquefaction - using mutant Bacillus alpha-amylase
Disclosure; Fig 4a; 56pp; English.
This sequence represents the M197T variant of the Bacillus
This sequence represents the M197T variant of the Bacillus
(I then invention, for liquefying a granular starch slurry from
the method of the invention, for liquefying a granular starch slurry from
a wet or dry milling process at a PH of 4 to less than 6, that comprises
adding a mutant Bacillus alpha-amylase to the slurry, optionally adding
an antioxidant, and reacting the slurry until the starch is liquefied.
The alpha-amylase has a substitution of Thr. Leu, Asn or Asp for a Met
residue corresponding to M15 in B. 1tcheniformis alpha-amylase.
Alternatively the alpha-amylase has a substitution of Leu or Ala for a
residue corresponding to M197 in B. 1icheniformis alpha amylase. Mutants
such as M197L and M15L have enhanced oxidative stability at PH 5.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- THE COAT PROTEIN VPI CONTAINS THE MAIN ANTIGENIC DETERMINANTS
THE VIRION; THEREFORE, CHANGES IN ITS SEQUENCE MUST BE
RESPONSIBLE FOR THE HIGH ANTIGENIC VARIABILITY OF THE VIRUS.
-!- SUBUNIT: THE VIRUS CAPSID IS COMPOSED OF 60 ICOSAHEDRAL UNITS,
EACH OF WHICH IS COMPOSED OF ONE COPY EACH OF PROTEINS VPI, VP3, AND VP4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FOOT-AND-MOUTH DISEASE VIRUS (APHTHOVIRUS C).

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri Jun 11 17:52:22 1999; MasPar time 2.45 Seconds 172.968 Million cell updates/sec

Tabular output not generated.

Title: >US-08-991-628-7
Description: (1-15) from US08991628.pep
Perfect Score: 9

Sequence: 1 QSGTMRTRHSTGGTN 15

Scoring table: PAM 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 24.516; Variance 27.383; scale 0.895

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 24.193; Variance 26.150; scale 0.925

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
